

ARUN TAMANG

Long Island City, NY | 385-445-2931 | arun.tamang@live.lagcc.cuny.edu
[Linkedin:04arun-tamang](#) | [Github:09aruntamg-coder](#) | [LeetCode:arun04-create](#)

SUMMARY OF QUALIFICATIONS

Computer Science student at LaGuardia Community College (CUNY) with hands-on experience in C, C++, and Python, and a strong foundation in object-oriented programming, arrays, binary tree, and algorithm design. Eager to apply technical skills in a hands-on setting and contribute to real-world software projects.

EDUCATION

LaGuardia Community College (CUNY) — Long Island City, NY Expected April 2027

A.S. in Computer Science | GPA: 3.96

Relevant Coursework: Object-Oriented Programming (C++) · Data Structures · Java Programming · Python Programming · Algorithms

Tech Talent Pipeline Residency (TTPR) Spring – Summer 2026

NYC Tech Talent Pipeline / LaGuardia Community College

Competitive residency combining a 10-week software engineering bootcamp with a paid summer internship. Focuses on technical skills (including DOM manipulation and React/JSX), professional development, and connecting students to NYC tech employers.

TECHNICAL SKILLS

Programming Languages: C, C++, Java, Python

Concepts: Object-Oriented Programming, Binary Tree, Algorithms, File Handling, Operator Overloading, Modular Design, Debugging

Tools & Platforms: Git, GitHub, VS Code, Console Application Development

TECHNICAL PROJECTS

Shipping Management System | C++ [Github:Shipping](#)

- Designed a multi-class console application simulating a full e-commerce shipping workflow using OOP principles, with separate classes for Customer, Product, Warehouse, and Shipping.
- Implemented dynamic shipping cost calculation based on package weight, delivery distance, and transport method (land, sea, or air), enabling realistic cost estimation across scenarios.
- Built wallet balance validation and receipt generation features, enforcing payment rules and producing itemized order summaries upon successful checkout.
- Applied modular programming techniques to separate business logic across classes, improving code maintainability and demonstrating real-world system modeling skills.

Rational Number Calculator | C++ [Github:Rational-Number-Calculator](#)

- Developed a class-based C++ calculator supporting full arithmetic operations (addition, subtraction, multiplication, division) on rational numbers expressed in fraction form (a/b).
- Overloaded arithmetic and logical operators to enable natural expression syntax, allowing fractions to be compared and combined using standard C++ operator notation.
- Implemented automatic fraction simplification using the Euclidean algorithm (GCD), ensuring all results are returned in lowest terms with correct sign handling.
- Added input validation and decimal conversion output, enabling users to enter fractions and receive both simplified fraction and floating-point representations.
